Continuation of 11, does NOT place the application in condition for allowance because: Applicant's arguments are not considered persuasive.

Applicant argued that Monga does not disclose automatic polling mechanisms. However, the link state announcements are automatic polling mechanisms because they are exchanged between devices to provide heartbeat functionality and connection determination for fault detection (see also, figs. 21-25, col. 14, lines 44-49 and col. 15, lines 30-39; col. 12, line 64 through col. 13, line 5). Applicant noted the polling operates between the terminal nodes, polling messages are exchanged between network nodes of different networks, and the polling is used to detect failure and verify when a node has been restored; however, these features are not caliened.

Applicant argued that the combination of references does not disclose client side alarm monitoring. However, the fallure of users is determined based on alarm monitoring on the client side of the network (co.l. 12, lines 62-65; col. 18, lines 22-5; note: the ASON device represents the client-side of the ASTN network which borders the client networks (figs. 2-3). The alarm is a degradation of a user signal which is monitored by the ASON device (col. 18, lines 22-27).
